Health is rooted in the circumstances of our daily lives and the environments in which we are born, grow, play, work, love and age. Understanding how community conditions affect our physical and mental health is the first step toward building a healthier New York City.

Note from Dr. Mary Bassett, Commissioner, New York City Department of Health and Mental Hygiene

New York City is a city of neighborhoods. Their diversity, rich history and people are what make this city so special.

But longstanding and rising income inequality, combined with a history of racial residential segregation, has led to startling health inequities between neighborhoods. Poor health outcomes tend to cluster in places that people of color call home and where many residents live in poverty. Life expectancy in Brownsville, for example, is 11 years shorter than in the Financial District. And this is not because residents of Brownsville are dying of unusual diseases, but because they are dying of the same diseases – mostly heart disease and cancer – at younger ages and at higher rates.

This is unfair and avoidable. A person’s health should not be determined by his or her ZIP code.

Reducing health inequities requires policymakers, health professionals, researchers and community groups to advocate and work together for systemic change. In One New York: The Plan for a Strong and Just City (OneNYC), Mayor Bill de Blasio has outlined a vision to transform this city, and every neighborhood, guided by the principles of growth, equity, sustainability and resiliency.

Our communities are not simply made up of individual behaviors, but are dynamic places where individuals interact with each other, with their immediate environments and with the policies that shape those environments. The Community Health Profiles include indicators that reflect a broad set of conditions that impact health.

Our hope is that you will use the data and information in these Community Health Profiles to advocate for your neighborhoods.

MARY T. BASSETT, MD, MPH
Navigating this document

This profile covers all of Brooklyn Community District 8, which includes Crown Heights, Prospect Heights and Weeksville, but the name is shortened to just Crown Heights and Prospect Heights. This is one of 59 community districts in New York City (NYC).

Community districts are ranked on each indicator. The highest rank (#1) corresponds to the largest value for a given measure. Sometimes a high rank indicates a positive measure of health (e.g., ranking first in flu vaccination). Other times, it indicates a negative measure of health (e.g., ranking first in the premature death rate).

The following color coding system is used throughout this document:

- **CROWN HEIGHTS AND PROSPECT HEIGHTS**
- **BEST-PERFORMING COMMUNITY DISTRICT**
- **BROOKLYN**
- **NEW YORK CITY**

  - Back cover
Housing quality
Poorly maintained housing is associated with negative health outcomes, including asthma and other respiratory illnesses, injuries and poor mental health. A higher percentage of homes in Crown Heights and Prospect Heights have maintenance defects compared with homes citywide.

Air pollution
Although NYC air quality is improving, air pollution, such as fine particles (PM$_{2.5}$), can cause health problems, particularly among the very young, seniors and those with preexisting health conditions. In Crown Heights and Prospect Heights, levels of PM$_{2.5}$, the most harmful air pollutant, are 8.8 micrograms per cubic meter, compared with 8.7 in Brooklyn and 8.6 citywide.

Retail environment
The prevalence of tobacco retailers in Crown Heights and Prospect Heights is similar to the prevalence citywide. Supermarket access is limited, with only 108 square feet per 100 people.
$ \text{SOCIAL AND ECONOMIC CONDITIONS} $

Higher education levels are associated with better health outcomes.

Over one-quarter of residents of Crown Heights and Prospect Heights live below the Federal Poverty Level.

Adult educational attainment

Two-fifths of Crown Heights and Prospect Heights adults have college degrees; however, one in five adults has not completed high school.

Highest level of education attained (adults 25 years and older)

Income

Living in poverty limits healthy lifestyle choices and makes it difficult to access health care and resources that can promote health and prevent illness. Unemployment and unaffordable housing are also closely associated with poverty and poor health. About one in eight Crown Heights and Prospect Heights adults ages 16 and older is unemployed, and more than half of all residents spend more than 30% of their monthly gross income on rent.

One way to consider the effect of income on health is by comparing death rates among neighborhoods. Assuming that the death rates from the five neighborhoods with the highest incomes are achievable in Crown Heights and Prospect Heights, it is estimated that 38% of deaths could have been averted.

Economic stress

Children and adolescents
The littlest New Yorkers all deserve the same opportunities for health. In Crown Heights and Prospect Heights, the rate of preterm births, a key driver of infant death, is similar to the NYC rate, but the teen birth rate is higher than the citywide rate. Over one-quarter of elementary school students miss 20 or more school days.

All: NYC DOHMH, Community Health Survey, 2011-2013

Smoking, diet and physical activity

Smoking, poor quality diet and physical inactivity are risk factors for high blood pressure, diabetes and other problems. Adults in Crown Heights and Prospect Heights smoke, eat fruits and vegetables and are physically active at rates similar to residents of Brooklyn and the city as a whole. However, adults in Crown Heights and Prospect Heights are more likely to consume sugary drinks than adults citywide.

Adults in Crown Heights and Prospect Heights are more than three times as likely to consume sugary beverages as Stuyvesant Town and Turtle Bay adults.
Obesity and diabetes

Obesity can lead to serious health problems such as diabetes and heart disease. At 33%, the rate of obesity in Crown Heights and Prospect Heights is over four times the rate in Stuyvesant Town and Turtle Bay. The diabetes rate in Crown Heights and Prospect Heights is 16%, the second-highest in the city.

Substance use

Drug- and/or alcohol-related hospitalizations reflect acute and chronic consequences of substance misuse. In Crown Heights and Prospect Heights, such hospitalization rates are higher than rates in Brooklyn and NYC; Crown Heights and Prospect Heights ranks tenth in both alcohol- and drug-related hospitalizations.

<table>
<thead>

Exercise is one way to maintain a healthy weight. Federal guidelines say that children should get 60 minutes of exercise per day, adults should get 150 minutes per week, and older adults should get 150 minutes per week as their physical abilities allow, with a focus on exercises to improve balance.
Access to health care
A lack of quality health care can lead to negative health outcomes and more intensive treatment, such as avoidable hospitalizations. The rates of Crown Heights and Prospect Heights adults who have no health insurance or go without needed medical care, including prenatal care, are similar to the citywide rates.

Prevention and screening
Compared with teens citywide, teenaged girls from Crown Heights and Prospect Heights are less likely to receive the full human papillomavirus (HPV) vaccine series. However, Crown Heights and Prospect Heights adults are more likely to get tested for HIV than adults citywide.
New HIV diagnoses
Some people with HIV do not know that they are infected. Getting diagnosed is the first step in the treatment and care of HIV. Crown Heights and Prospect Heights ranks twentieth in the rate of new HIV diagnoses.

Stroke
High blood pressure is the leading risk factor for stroke and the most important to control. The rate of stroke hospitalizations in Crown Heights and Prospect Heights is higher than the citywide rate.

Mental health
Variations in hospitalization rates may reflect differences in rates of illness, access to health care and other social and cultural factors. Crown Heights and Prospect Heights has the third-highest rate of adult psychiatric hospitalizations in the city.
**Child asthma**

Many hospitalizations for asthma among children could be prevented by addressing housing-related exposures to asthma triggers, including cockroaches, mice and secondhand smoke. Good medical management can prevent asthma symptoms. **Crown Heights and Prospect Heights** has the fifth-highest asthma hospitalization rate among children ages 5 to 14, more than twice the citywide rate.

---

Certain hospitalizations for asthma and diabetes can be prevented by high-quality outpatient care and are known as “avoidable hospitalizations.”
Leading causes of death

The top causes of death for residents of Crown Heights and Prospect Heights, as for most New Yorkers, are heart disease and cancer. Death rates due to HIV and nephritis are more than twice the citywide rates.

HIV is the eighth most common cause of death in Crown Heights and Prospect Heights, but it is only the tenth leading cause citywide.

Infant mortality and premature death

The infant mortality rate in Crown Heights and Prospect Heights is higher than the Brooklyn rate and more than seven times the Upper East Side rate.

Disparities in premature death (death before the age of 65) persist among neighborhoods. The rate of premature death in Crown Heights and Prospect Heights is higher than the Brooklyn and citywide rates and more than three times the rate in the Financial District.
NOTES

A complete dataset including numbers, rates, rankings and confidence intervals, as well as definitions and complete citations, can be found online by going to nyc.gov and searching “Community Health Profiles”.

Technical notes

Neighborhood Definitions and Rankings
The 59 Community Districts (CDs) were established citywide by local law in 1975. For a complete listing of all CDs and their boundaries, go to nyc.gov/html/dcp/html/neighborhood/nhmap.shtml. The CDs correspond to New York City (NYC) Community Boards, which are local representative bodies. The names of neighborhoods within CDs are not officially designated. The names used in this document are not an exhaustive list of all known neighborhood names within this area. CDs were ranked on every indicator. If two CDs had the same value, they were considered to be tied and given the same rank.

For American Community Survey (ACS) and NYC Department of Health and Mental Hygiene (DOHMH) Community Health Survey (CHS) indicators, data were available by Public Use Microdata Areas (PUMAs), which are aggregated Census tracts designed to approximate CDs. For Housing and Vacancy Survey (HVS), data were available by sub-borough areas. The U.S. Census Bureau combined four pairs of CDs in creating these PUMA or sub-borough areas to improve sampling and protect the confidentiality of respondents. These pairs are Mott Haven/Melrose (BX 01) and Hunts Point/Longwood (BX 02) in the Bronx, Morrisania/Crotona (BX 03) and Belmont/East Tremont (BX 06) in the Bronx, the Financial District (MN 01) and Greenwich Village/Soho (MN 02) in Manhattan and Clinton/Chelsea (MN 04) and Midtown (MN 05) in Manhattan. For these four areas, the same estimate was applied to both CDs that comprised the PUMA or sub-borough area for data from ACS, CHS and HVS.

Analyses
For most data, 95% confidence limits were calculated for neighborhood, borough and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. Only robust findings found to be statistically significant are discussed in the text. In addition, most estimates were evaluated for statistical stability using the relative standard error (RSE). Those estimates with an RSE greater than 30% are flagged as follows: “Interpret estimate with caution due to small number of events or small sample size.” Where noted, estimates in this report were age standardized to the Year 2000 Standard Population.

Data Sources

U.S. Census/American Community Survey (ACS): The U.S. Census calculates intercensal population estimates which were used for overall population, age, race and ethnicity indicators. The ACS is an ongoing national survey conducted by the U.S. Census Bureau. Indicators include limited English proficiency, foreign born percentage, adult educational attainment, poverty, unemployment and rent burden. Three-year estimates (2011-2013) are used to improve reliability of the data.

NYC DOHMH Community Health Survey (CHS): The CHS is an annual random-digit-dial telephone survey of approximately 9,000 adults in NYC. Indicators include self-reported health, smoking, average daily sugary drink consumption, fruit and vegetable consumption, physical activity, obesity, diabetes, insurance coverage, went without needed care, flu vaccination and HIV testing. A combined-year dataset (2011-2013) was used to increase statistical power, allowing for more stable analyses at the Community District level. Community District level estimates were imputed based on participant’s ZIP code, age, race and ethnicity, sex and borough of residence. All indicators are age-adjusted; however crude estimates and rankings are available online in the complete dataset.

NYC DOHMH Vital Statistics: The Bureau of Vital Statistics analyzes data that it collects from hundreds of thousands of birth and death certificates issued in NYC each year by the Bureau of Vital Records. Indicators include preterm births, teen births, prenatal care, leading causes of death, infant mortality, premature mortality, avertable deaths and life expectancy. For some indicators, data sources were combined across three, five or ten years to increase statistical stability and average annual rates are presented. For this reason, these statistics may differ from the presentation in the “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH. All rates are shown as crude rates, except leading causes of death and premature mortality rates, which are age-adjusted.

New York State (NYS) Department of Health Statewide Planning and Research Cooperative System (SPARCS): SPARCS is a statewide comprehensive all payer data reporting system established in 1979 currently collecting patient level detail on patient characteristics, diagnoses and treatments, services and charges for each hospital inpatient stay and outpatient visit (ambulatory surgery, emergency department and outpatient services); and each ambulatory
surgery and outpatient services visit to a hospital extension clinic and diagnostic and treatment center licensed to provide ambulatory surgery services. Indicators include non-fatal assault hospitalizations, alcohol-related hospitalizations, drug-related hospitalizations, child asthma hospitalizations, avoidable adult asthma hospitalizations, avoidable adult diabetes hospitalizations, psychiatric hospitalizations and stroke hospitalizations. Hospitalization data are defined according to International Classification of Disease Clinical Modification, Version 9 (ICD-9-CM) codes. Most of these hospitalization indicators show 2012 data, updated in December 2014. For child asthma hospitalizations and non-fatal assault hospitalizations, data sources were combined across two and three years respectively to increase statistical stability and average annual rates are presented.

All indicators are age-adjusted, except child asthma hospitalizations, which is age-specific.

**NYC Housing and Vacancy Survey (HVS):** HVS data from 2011 were used to estimate the percent of renter-occupied homes with at least one maintenance issue (defect). Data were obtained from the NYC Housing Preservation and Development Report: Housing New York City 2011.

**NYC Community Air Survey (NYCCAS):** 2013 annual averages of micrograms of fine particulate matter per cubic meter were calculated from air samples collected at specific NYCCAS monitoring sites and were incorporated into a statistical model that predicted pollutant concentrations.

**NYC Department of Consumer Affairs:** 2014 tobacco retail density data were analyzed by the NYC DOHMH Bureau of Chronic Disease Prevention and Tobacco Control.

**NYS Department of Agriculture and Markets:** Based on data from 2014, the supermarket square footage rate was analyzed by the NYC Department of City Planning and the NYC DOHMH Bureau of Epidemiology Services.

**NYC Department of Education:** Elementary school absenteeism data for the 2013-14 school year were analyzed from FITNESSGRAM data by the NYC DOHMH Bureau of Epidemiology Services.

**NYC Department of Corrections:** The average daily population of incarcerated persons in NYC jails ages 16 and older by CD of last known residence. Based on NYC Department of Corrections (DOC) bi-weekly in-custody files from July 1 to Oct 9, 2014.

**NYC DOHMH Citywide Immunization Registry:** 2014 HPV vaccination data were analyzed by the NYC DOHMH Bureau of Immunization.

**NYC DOHMH HIV/AIDS Surveillance Registry:** New HIV diagnosis data for 2013 were analyzed by the NYC DOHMH Bureau of HIV/AIDS Prevention and Control.
